# Fans, Heaters and Air Washers

A BOOK OF INFORMATION FOR  
ARCHITECTS AND ENGINEERS  
Containing Complete Tables of Capacities and  
Power Requirements of All Types and Sizes  
of Sturtevant Fans, Heaters, and Air Washers

**B. F. STURTEVANT COMPANY**  
HYDE PARK :: BOSTON :: MASSACHUSETTS  
AND ALL PRINCIPAL CITIES OF THE WORLD

*Publication No. 250*  
Copyright, 1917  
B. F. Sturtevant Company

## PURPOSE OF THIS BOOK

With the steady development of the use of fans, heaters, and air washers for all industrial purposes, there has sprung up a need for a book that will give in concise form the information required to properly select this apparatus to meet given requirements. Not an abbreviated compilation suitable for use only for a limited number of applications, but one that will give to the architect or the engineer information covering a wide range of types and sizes adapted to every industrial need.

In the compilation of this book, the B. F. Sturtevant Company have purposely avoided devoting large space to theories which are probably familiar to most architects and engineers. They have instead, devoted the book to actual information on performances.

The B. F. Sturtevant Company, building the most complete line of fans and allied apparatus as well as the largest quantity, are in a position to supply this apparatus to meet any requirements and in this book will be found the principal dimensions, capacities and horse powers over a wide range of service of their complete lines.

Knowing the requirements, it is an easy matter to select the type and size of apparatus to fulfill them to the best advantage, and also to find the principal dimensions that will aid in making the preliminary layout.

A careful reading of the explanation of tables at the beginning of each section will show clearly the basis upon which the tests were made and will aid greatly in selecting the proper apparatus.

It is with the desire to aid those whose work it is to select and apply apparatus to various industrial problems that the B. F. Sturtevant Company have gone to the great expense entailed in the publication of this book. If our friends to whom this book is loaned find it of assistance, then its object is fulfilled and the expense is warranted.

## DEFINITIONS

**Blower or Double Inlet Fan.** A Centrifugal Blower is a cased fan wheel having two inlets for the admission of air, one on either side and each concentric with the shaft.

**Exhauster or Single Inlet Fan.** An Exhauster is of much the same construction as a Blower, but has only one inlet, and that usually in the side farthest from the pulley, engine, turbine or motor.

**Overhung Wheel Fan.** An Overhung Wheel Fan is one where the wheel is overhung upon the shaft, that is, where both of the bearings supporting the shaft are on one side of the wheel. This is usually arranged so that the pulley runs between the two bearings, and the shaft is extended through the fan casing to take the wheel. Exhausters are nearly always of the Overhung Wheel type, except in the larger sizes.

**Overhung Pulley Fan.** An Overhung Pulley Fan is one in which there is a bearing on either side of the fan wheel. The shaft being extended through one of the bearings to take the pulley which is overhung upon it. Blowers and large Exhausters are usually of the Overhung Pulley type.

**Discharge.** The discharge of a Blower or Exhauster is designated by the direction in which the air is delivered from the casing; as for instance, bottom horizontal discharge or upblast discharge.

**Hand.** The hand of a fan is that which designates upon which side of the casing the pulley or other driving apparatus is located, when one is facing the outlet of the fan. A right hand fan is one having the pulley, engine, turbine or motor on the right as one faces the outlet, and a left hand fan is one having the pulley, engine, turbine or motor on the left as one faces the outlet. An exception to the above occurs when the pulley, engine, turbine or motor is placed in the inlet of a single inlet fan, in which case the housing itself may be left hand, and yet the pulley, engine, turbine or motor may be on the right. In such cases, which are very infrequent and usually impracticable, full explanation should be given to avoid confusion.

With up or down angular discharge also the hand is determined by the location of the motor, turbine, pulley or engine, when the observer stands at the discharge end of the fan.

**Full Housing Fans.** A fan with full housing has a complete scroll or casing.

**Three-quarters and Seven-eighths Housing Fans.** When the lower portion of the scroll is dispensed with, and the fan is located upon a foundation which serves the purpose of a lower part of the casing, the fan is called three-quarters housing fan, in the Steel Plate type, and seven-eighths housing fan in the Multivane type.

---

All dimensions given in this book are for approximate use, and should not be used for foundation drawings, etc. Blue Prints containing dimensions will be furnished for this work.

C.F.M. = Cubic feet per minute.

R.P.M. = Revolutions per minute.

F.P.M. = Feet per minute.

S.N.D. = Static no delivery.

O.S. Dia. = Outside diameter.

Steam Pressure = Pounds per sq. inch.

All dimensions given in inches.

## **General Explanation of Tables**

The free delivery of air from every fan as actually installed is unavoidably retarded by the frictional resistance of the surfaces with which the moving air is in contact and by changes in its velocity and direction of motion.

In any system of conduits, the sum of all these resistances is always the same when a given volume of air, or gas at a given density, is flowing, and is generally called the "maintained resistance" of the system. It is usually referred to in terms of the static pressure required to overcome the "maintained resistance," and is measured in inches of water.

The "maintained resistance" of any system varies directly as the square of the volume delivered through the system and directly as the density of the air or gas handled.

All the capacity tables in this book give the speed and shaft horsepower required to deliver any volume against any maintained resistance within the capacity of the fan referred to.

All tables unless otherwise stated are calculated for air having a density of .075 lbs. per cubic foot, which is the density of normal air at 65° F. and at sea level, or what may be called standard air. The calculations are based in all cases upon the results of carefully conducted tests made in our testing laboratory. The volumes were determined from velocities measured, unless otherwise stated, in a pipe the size of the fan outlet, by means of a pitot tube of the pin-hole form. A sufficient number of readings of the velocity head were taken at properly located points in the pipe to determine the average velocity accurately. The static pressures were read from the static side of the same pitot tube and averaged.

### **EFFECT OF TEMPERATURE AND ALTITUDE**

The maintained resistance against which any fan at a given speed will deliver a certain volume, varies directly as the density of the air or gas handled, and the shaft horsepower required, also varies directly as the density.

Whenever it is desired to select a fan to handle air of a greater or less density than .075 lbs. per cubic foot owing to a different temperature, or altitude, or gas of a composition different from air, the above facts must be applied in using the tables.

Since the pressure varies directly with the density it follows that the table pressure under which the fan is to be chosen for a given volume at a given speed must bear the same ratio to the required pressure as does air at "normal" density to the density of the air or gas being considered. For instance, if the density of the air to be used is .5 that of standard air, then the pressure actually obtained will be only .5 of that shown in the tables. Therefore, the fan must be picked under a pressure such that .5 of it will be the pressure required, e.g., if 1" is the desired pressure with air whose density is .5 of standard air, the fan must be picked under the 2" column, then the actual pressure will be 1". Usually the reciprocal is used in finding the table pressure, that is, for the above, standard air is two times heavier than the air under consideration and the table pressure equals  $1 \times 2$  equals 2".

It is obvious that the horse-power shown under the table pressure, which is, of course, the horse-power for air at .075 density, will be too high by the same ratio as that of the densities, because the volume and speed are the same and the density, and in consequence the pressure, is the only factor that has changed. Therefore, the table horse-power must be multiplied by the ratio of density to obtain the true horse-power. In the above example the actual horse-power would be .5 of that shown in the table under the 2" pressure column.

When choosing a fan to operate at high efficiency, not only must a proper size be used but in addition the fan must run at an efficient speed. As an aid to customers we have placed black lines under certain volumes and horsepowers, and one of the performances above the black underline in any particular column should be chosen.

## SPECIFICATIONS

**General.** There shall be furnished a No. ...., design No. 2, Sturtevant Multivane Fan. It shall be made (single or double) ..... inlet, (single or double) ..... width, (right or left) ..... hand, ..... discharge and have (full or  $\frac{1}{4}$ ) ..... housing. The wheel shall be not less than ..... " diameter. The outlet shall be .... " by ..... ", the diameter of the inlet shall be ..... ". The total height of the fan housing shall be ..... ", the width in direction of shaft ..... ", and the length transverse to shaft ..... ".

The fan shall have a capacity of ..... cubic feet per minute against a resistance of ..... " water gauge either at the inlet or at the outlet (or at both taking the sum) and shall operate at approximately ..... R.P.M., requiring approximately ..... B.H.P.

**Housing.** The housing shall be of spiral form constructed of steel plate strongly braced, bolted and riveted to a rigid frame of angle irons. The side plates and round-about sheet shall be made of No. 11 gauge for fans above 45" high. The smaller sizes shall have these parts made of No. 14 gauge plate. The outlet shall be rectangular in shape and consist of angle irons bolted to the housing and arranged for connection to a discharge duct. The inlet shall be of cone shape and so constructed as to allow the wheel to be taken out through the opening caused by the removal of the cone. In the single inlet fan the side opposite the inlet shall be closed by a dished plate bolted to the side of the housing. The cutoff piece shall be made of a sheet bent 180 degrees upon itself and having the two ends bolted to the spiral sheet, thus leaving no edges of metal which can in any way be acted upon by the air issuing from the outlet so as to produce vibration, and therefore, noise at this point.

**Wheel.** The blades of the wheel shall be made of refined steel plate and spooned with spherical depressions to efficiently handle the air. The blades shall be pressed and formed while hot by means of punch and die to insure uniformity and strength in the blades throughout the wheel. The hub shall be made of cast iron having cast integral with it and emanating from it, steel arms of "T" section. The hub shall be accurately bored and fitted with keyway and set screws. The blades shall be riveted at either end to annular steel plate rings or side plates. The holes through which the blades are riveted to the side plates shall be punched to template, as well as the blades themselves, to insure the proper position of each blade in the wheel. For diameters above 46", a third annular ring shall be placed in the center of the wheel, and two hubs used instead of one. The outer ends of the "T" arms emanating from the hub shall be riveted to the center portion of the driving blades which shall be of thicker metal than the intermediate blades. The wheel shall be absolutely symmetrical either side of its center, and having no back plate can be used for either a right or left hand fan, and have either single or double inlet. The wheel shall be very carefully balanced.

**Bearings.** The bearings shall be of the spherical self-aligning ring oiled type and bolted to their support. They shall be of large diameter and built extra long to give ample bearing surface. Each bearing shall be fitted with two oil rings which feed oil on to the shaft from a large oil well located in the bottom part of the box. The bearings shall be lined with the best quality babbitt, containing upwards of 85% tin, bored and scraped to exact size.

**Shaft.** The shaft shall be made of steel forging and after the keyways are cut, shall be accurately turned and ground.

## MULTIVANE FAN—DESIGN 2

### EXPLANATION OF SPECIFICATION REQUIREMENTS

**Noise.** Special attention is called to the construction of the cut-off point, which, considering fans in general, is the seat of most noise in the nature of a sustained metallic note. Obviously any edge of metal whether directly or indirectly in the flow of air can be acted upon more or less like a reed and the design of cut-off in this fan avoids this condition.

The flow of air over the surfaces in a fan wheel and casing obviously produces any noise which may exist (a fan wheel revolving in a vacuum will produce no noise, assuming of course, proper mechanical balance in the wheel). The noise is also a function of the velocity of flow. In this fan the velocity at all points as the air passes through the wheel is lower than in the general run of fans of this type or as used for this service, thereby operating against the production of noise.

**Distribution of Work and Stresses.** The spherical depressions grip the air and prevent it from slipping along the blade to the side of the wheel opposite the inlet, thus distributing the work along the entire length of the blade.

The driving arms of the hub being attached to the center of the driving blades, in other words at a point one-half way along their axial length, produce a construction in which the stresses coming upon it in operation are perfectly distributed and balanced.

**Strength and Rigidity.** Not only is the driving effort applied at the logical and proper point but this has the added feature of holding the wheel in shape and preventing the blades from bowing out. Each blade is like a uniformly loaded beam when the fan is in operation, that is, centrifugal force is acting alike on each element of the blade. Under high speed an improperly designed wheel will first show signs of failing in the bending or bowing out of the blades at their center, which in turn moves the two side plates nearer together. Without a center support construction there is nothing to stop the movement of the side plates toward each other except the ability of the blade to resist bending (not stretching). With the center support construction, however, the driving blades are tied down at their center by their connection to the driving arms, thus producing a strut or spacing piece at each point where the driving blade is located which will not permit the side plates to move toward each other. The intermediate blades, therefore, to bulge or bow out must either stretch themselves or pull the rivets.

**Additional Strength in Larger Sizes.** In sizes No. 10 and above the center arm carries out to a much greater degree the strengthening feature of tying the blades at the center, thereby doing away with any chance of bowing out. That is, every blade in the wheel is tied down at the center. The spider arm construction with center support is considerably stronger than the usual designs of wheel supported from the back.

**Wearing Qualities.** Barring the metal of the fan itself being subjected to violent corrosion or chemical action of gases handled by the fan the brunt in the long run is borne by the shaft and bearings. Therefore, for long satisfactory service a shaft which is carefully turned and ground to gauge running in bearings containing a very high quality babbit metal is bound to show its worth.

## **Multivane Fan—Design 2**

### **EXPLANATION OF TABLES**

The capacities in the following tables are measured in a pipe having an area fifty percent greater than the fan outlet. The proportions of these fans are such that the outlet velocities are high at normal load. By expanding from the outlet to a fifty percent larger pipe a part of this velocity is transformed into useful pressure, thereby increasing the efficiency of the fan.

In cases where this expansion is not used a correction should be made by reducing the maintained resistance from the value at the head of the tables by an amount equal to forty five percent of the velocity head in the fan outlet.

For further information we refer you to the general explanation of tables at the front of the book.

Single Inlet

## No. 5 Multivane Fan — Design 2

Single Width

When Discharging Air at 65° F and Density .075 lbs. per cubic foot Against Continuously Maintained Resistances

Double Inlet

## No. 9 Multivane Fan — Design 2

Double Width

When Discharging Air at 65° F and Density .075 lbs. per cubic foot Against Continuously Maintained Resistances

Double Inlet

## No. 11 Multivane Fan — Design 2

Double Width

When Discharging Air at 65 F and Density .075 lbs. per cubic foot Against Continuously Maintained Resistances

Double Inlet

## No. 14 Multivane Fan—Design 2

Double Width

When Discharging Air at 65° F and Density .075 lbs. per cubic foot Against Continuously Maintained Resistances

Double Inlet

## No. 17 Multivane Fan—Design 2

Double Width

When Discharging Air at 65° F and Density .075 lbs. per cubic foot Against Continuously Maintained Resistances

# **MULTIVANE FANS**

## **Design 3**

**Dimensions, Capacities, Horse Powers**

## Multivane Fan—Design 3

Design No. 3 Multivane Fan

Design No. 3 Multivane Wheel

# MULTIVANE FAN—DESIGN 3

## SPECIFICATIONS

**General.** There shall be furnished a No. ...., design No. 3, Sturtevant Multivane Fan. It shall be made (single or double) ..... inlet, (single or double) ..... width, (right or left) ..... hand, ..... discharge and have (full or  $\frac{3}{8}$ ) ..... housing. The wheel shall be not less than ..... " diameter. The outlet shall be ..... " by ..... ", the diameter of the inlet shall be ..... ". The total height of the fan housing shall be ..... ", the width in direction of shaft ..... ", and the length transverse to shaft ..... ".

The fan shall have a capacity of ..... cubic feet per minute against a resistance of ..... " water gauge either at the inlet or at the outlet (or at both taking the sum) and shall operate at approximately ..... R.P.M., requiring approximately ..... B.H.P.

**Housing.** The housing shall be of spiral form constructed of steel plate strongly braced, bolted and riveted to a rigid frame of angle irons. The side plates and round-about sheet shall be made of No. 11 gauge for fans above 45" high. The smaller sizes shall have these parts made of No. 14 gauge plate. The outlet shall be rectangular in shape and consist of angle irons bolted to the housing and arranged for connection to a discharge duct. The inlet shall be of cone shape and so constructed as to allow the wheel to be taken out through the opening caused by the removal of the cone. In the single inlet fan the side opposite the inlet shall be closed by a dished plate bolted to the side of the housing. The cutoff piece shall be made of a sheet bent 180 degrees upon itself and having the two ends bolted to the spiral sheet, thus leaving no edges of metal which can in any way be acted upon by the air issuing from the outlet so as to produce vibration, and therefore, noise at this point.

**Wheel.** The blades of the wheel shall be made of refined steel plate and spooned with spherical depressions to efficiently handle the air. The blades shall be pressed and formed while hot by means of punch and die to insure uniformity and strength in the blades throughout the wheel. The hub shall be made of cast iron having cast integral with it and emanating from it, steel arms of "T" section. The hub shall be accurately bored and fitted with keyway and set screws. The blades shall be riveted at either end to annular steel plate rings or side plates. The holes through which the blades are riveted to the side plates shall be punched to template, as well as the blades themselves, to insure the proper position of each blade in the wheel. For diameters above 46", a third annular ring shall be placed in the center of the wheel, and two hubs used instead of one. The outer ends of the "T" arms emanating from the hub shall be riveted to the center portion of the driving blades which shall be of thicker metal than the intermediate blades. The wheel shall be absolutely symmetrical either side of its center, and having no back plate can be used for either a right or left hand fan, and have either single or double inlet. The wheel shall be very carefully balanced.

**Bearings.** The bearings shall be of the spherical self-aligning ring oiled type and bolted to their support. They shall be of large diameter and built extra long to give ample bearing surface. Each bearing shall be fitted with two oil rings which feed oil on to the shaft from a large oil well located in the bottom part of the box. The bearings shall be lined with the best quality babbit, containing upwards of 85% tin, bored and scraped to exact size.

**Shaft.** The shaft shall be made of steel forging and after the keyways are cut, shall be accurately turned and ground.

# MULTIVANE FAN—DESIGN 3

## EXPLANATION OF SPECIFICATION REQUIREMENTS

**Noise.** Special attention is called to the construction of the cut-off point, which, considering fans in general, is the seat of most noise in the nature of a sustained metallic note. Obviously any edge of metal whether directly or indirectly in the flow of air can be acted upon more or less like a reed and the design of cut-off in this fan avoids this condition.

The flow of air over the surfaces in a fan wheel and casing obviously produces any noise which may exist (a fan wheel revolving in a vacuum will produce no noise, assuming of course, proper mechanical balance in the wheel). The noise is also a function of the velocity of flow. In this fan the velocity at all points as the air passes through the wheel is lower than in the general run of fans of this type or as used for this service, thereby operating against the production of noise.

**Distribution of Work and Stresses.** The spherical depressions grip the air and prevent it from slipping along the blade to the side of the wheel opposite the inlet, thus distributing the work along the entire length of the blade.

The driving arms of the hub being attached to the center of the driving blades, in other words at a point one-half way along their axial length, produce a construction in which the stresses coming upon it in operation are perfectly distributed and balanced.

**Strength and Rigidity.** Not only is the driving effort applied at the logical and proper point but this has the added feature of holding the wheel in shape and preventing the blades from bowing out. Each blade is like a uniformly loaded beam when the fan is in operation, that is, centrifugal force is acting alike on each element of the blade. Under high speed an improperly designed wheel will first show signs of failing in the bulging or bowing out of the blades at their center, which in turn moves the two side plates nearer together. Without a center support construction there is nothing to stop the movement of the side plates toward each other except the ability of the blade to resist bending (not stretching). With the center support construction, however, the driving blades are tied down at their center by their connection to the driving arms, thus producing a strut or spacing piece at each point where the driving blade is located which will not permit the side plates to move toward each other. The intermediate blades, therefore, to bulge or bow out must either stretch themselves or pull the rivets.

**Additional Strength in Larger Sizes.** In sizes No. 10 and above the center annulus carries out to a much greater degree the strengthening feature of tying the blades at the center, thereby doing away with any chance of bowing out. That is, every blade in the wheel is tied down at the center. The spider arm construction with center support is considerably stronger than the usual designs of wheel supported from the back.

**Wearing Qualities.** Barring the metal of the fan itself being subjected to violent corrosion or chemical action of gases handled by the fan the brunt in the long run is borne by the shaft and bearings. Therefore, for long satisfactory service a shaft which is carefully turned and ground to gauge running in bearings containing a very high quality babbit metal is bound to show its worth.

## **Multivane Fan—Design 3**

### **EXPLANATION OF TABLES**

These fans have very large outlets compared to their capacity and consequently they have low outlet velocities. The large outlet when connected to a pipe of the same size produces a chimney effect which converts a large part of the velocity in the casing into useful pressure. These fans should not be used without a pipe upon the outlet because without the pipe the conversion effect is largely lost. Neither should they be used upon a pipe of less area than the outlet of the fan.

Other than the above exception the general explanation of tables at the front of this book applies.

## Multivane Fan—Design 3

Double Inlet

## No. 12 Multivane Fan — Design 3

Single Width

When Discharging Air at 65 F and Density .075 lbs. per cubic foot Against Continuously Maintained Resistances

Double Inlet

## No. 16 Multivane Fan — Design 3

Single Width

When Discharging Air at 65° F and Density .075 lbs. per cubic foot Against Continuously Maintained Resistances

Double Inlet

## No. 2 Multivane Fan — Design 3

Double Width

When Discharging Air at 65° F and Density .075 lbs. per cubic foot Against Continuously Maintained Resistances

Double Inlet

## No. 4 Multivane Fan—Design 3

Double Width

When Discharging Air at 65° F and Density .075 lbs. per cubic foot Against Continuously Maintained Resistances

Double Inlet

## No. 24 Multivane Fan—Design 3

Double Width

When Discharging Air at 65° F and Density .075 lbs. per cubic foot Against Continuously Maintained Resistances

Double Inlet

## No. 26 Multivane Fan—Design 3

Double Width

When Discharging Air at 65° F and Density .075 lbs. per cubic foot Against Continuously Maintained Resistances

# **SUPERVANE FANS**

## **Design 1**

**Dimensions, Capacities, Horse Powers**

## Supervane Fan

Sturtevant Supervane Fan—Design 1

Supervane Wheel

# SUPERVANE FAN—DESIGN 1

## SPECIFICATIONS

**General.** There shall be furnished a No. . . . ., Sturtevant Supervane Fan. It shall be made (single or double) . . . . . inlet, (single or double) . . . . . width, (right or left) . . . . . hand, . . . . . discharge and have (full or  $\frac{7}{8}$ ) . . . . . housing. The wheel shall be not less than . . . . . " diameter, . . . . . " wide. The outlet shall be . . . . . " by . . . . . ", the diameter of the inlet shall be . . . . . ". The total height of the fan housing shall be . . . . . ", the width in direction of shaft . . . . . ", and the length transverse of shaft . . . . . ".

The fan shall have a capacity of . . . . . cubic feet per minute against a resistance of . . . . . " water gauge either at the inlet or at the outlet (or at both taking the sum) and shall operate at approximately . . . . . R.P.M., requiring approximately . . . . . B.H.P.

**Housing.** The housing shall be of spiral form constructed of steel plate and angle irons strongly braced and bolted and riveted to a rigid frame of angle irons. The side plates and round-about sheet shall be made of No. 11 gauge for fans above 45" high. The few smaller sizes shall have these parts made of No. 14 gauge plate. The outlet shall be rectangular in shape and consist of angle irons bolted to the housing and arranged for connection to a discharge duct. The inlet shall be of cone shape and so constructed as to allow the wheel to be taken out through the opening caused by the removal of the cone. In the single inlet fan the side opposite the inlet shall be closed by a dished plate bolted to the side of the housing. The cutoff piece shall be made of a sheet bent 180 degrees upon itself and having the two ends bolted to the spiral sheet, thus leaving no edges of metal which can in any way be acted upon by the air issuing from the outlet so as to produce vibration, and therefore, noise at this point.

**Wheel.** The blades of the wheel shall be made of refined steel plate. Both the outer or discharge edge and the inner or intake edge of the blade shall have a maximum diameter at the side plates of the wheel. The diameter of each of these edges shall diminish as the center of the wheel is approached, at which point it is a minimum. The outer edge of the blade shall not be in a plane through the axis but shall recede gradually from either side plate in to the center of the wheel while the inner edge at all points shall lie in a plane through the axis of the fan. The inner edge of the blade at the center shall be relatively of very small diameter extending in almost to the hub of the wheel. The blade shall be dished and curved forward in such a manner as to most efficiently handle the air from the time it enters till it leaves the blade. The blades shall be pressed and formed while hot by means of punch and die to insure uniformity and strength in the blades throughout the wheel. The hub shall be made of cast iron having cast integral with it and emanating from it, steel arms of "T" section. The hub shall be accurately bored and fitted with keyway and set screws. The blades shall be riveted at either end to annular steel plate rings or side plates. The holes through which the blades are riveted to the side plates shall be punched to template as well as the blades themselves, to insure the proper position of each blade in the wheel. The outer ends of the "T" arms emanating from the hub shall be riveted to the center portion of the driving blades which shall be of thicker metal than the intermediate blades. The wheel shall be absolutely symmetrical either side of its center, and having no back plate can be used for either a right or left hand fan, and have either single or double inlet. The wheel shall be very carefully balanced.

**Bearings.** The bearings shall be of the spherical self-aligning ring oiled type and bolted to their support. They shall be of large diameter and built extra long to give ample bearing surface. Each bearing shall be fitted with two oil rings which feed oil on to the shaft from a large oil well located in the bottom part of the box. The bearings shall be lined with the best quality babbit, containing upwards of 85% tin, bored and scraped to exact size.

**Shaft.** The shaft shall be made of steel forging and after the keyways are cut, shall be accurately turned and ground.

# SUPERVANE FAN—DESIGN 1

## EXPLANATION OF SPECIFICATION REQUIREMENTS

**Noise.** Special attention is called to the construction of the cut-off point, which, considering fans in general, is the seat of most noise in the nature of a sustained metallic note. Obviously any edge of metal whether directly or indirectly in the flow of air can be acted upon more or less like a reed and the design of cut-off in this fan avoids this condition.

The flow of air over the surfaces in a fan wheel and casing obviously produces any noise which may exist (a fan wheel revolving in a vacuum will produce no noise, assuming of course, proper mechanical balance in the wheel). The noise is also a function of the velocity of flow. In this fan the velocity at all points as the air passes through the wheel is lower than in the general run of fans of this type or as used for this service, thereby operating against the production of noise.

**Provision for Minimizing Losses.** The greater diameter of the blade at each side plate does away with the loss due to air pockets, hence eddy currents, ordinarily existing in this portion of the blade. The projection of the intake edge of the blade deep into the intake chamber picks up the air with less shock and delivers it to the outer or major portion of the blade where for the most part the work on the air is done.

**Distribution of Stresses.** The driving arms of the hub being attached to the center of the driving blades, in other words at a point one-half way along their axial length, produce a construction in which the stresses coming upon it in operation are perfectly distributed and balanced.

**Strength and Rigidity.** Not only is the driving effort applied at the logical and proper point but this has the added feature of holding the wheel in shape and preventing the blades from bowing out. Each blade is like a uniformly loaded beam when the fan is in operation, that is, centrifugal force is acting alike on each element of the blade. Under high speed an improperly designed wheel will first show signs of failing in the bulging or bowing out of the blades at their center, which in turn moves the two side plates nearer together. Without a center support construction there is nothing to stop the movement of the side plates toward each other except the ability of the blade to resist bending (not stretching). With the center support construction, however, the driving blades are tied down at their center by their connection to the driving arms, thus producing a strut or spacing piece at each point where the driving blade is located which will not permit the side plates to move toward each other. The intermediate blades, therefore, to bulge or bow out must either stretch themselves or pull the rivets. The spider arm construction with center support is considerably stronger than the usual designs of wheel supported from the back.

**Wearing Qualities.** Barring the metal of the fan itself being subjected to violent corrosion or chemical action of gases handled by the fan the brunt in the long run is borne by the shaft and bearings. Therefore, for long satisfactory service a shaft which is carefully turned and ground to gauge running in bearings containing a very high quality babbit metal is bound to show its worth.
